

GEAR SHIFT MECHANISM LUBRICATION

It is VERY important to maintain an easy and smooth gear shift operation. All the points on the gear shift assembly linkage MUST be kept clean and well lubricated with a good quality grease.

Please note the points needing regular attention

NOTE: This is a VERY important lube point. The gear select shaft is inside this rubber cover and is the entry point to the gear box interior. When washing the mower water can get inside the rubber cover and cause the shaft to rust and make it difficult to select neutral, drive and reverse. Regularly clean this area then engage forward gear (with the engine OFF), now lift the rubber cover and OIL the shaft where it enters the gearbox. Move the gear shift through forward and reverse positions a number of times to ensure the shaft is well lubricated

HAPPY MOWING
